unfolds in a series of distinct stages

Initiation The process begins at specific origin sites on the DNA molecule where the double helix unwinds

Elongation DNA polymerases synthesize new DNA strands using the existing template strands as guides This process occurs simultaneously on both strands with one strand being synthesized continuously and the other in short fragments called Okazaki fragments

Termination The replication process concludes when all DNA has been copied and the newly synthesized strands are joined together

3 Why is DNA replication semiconservative DNA replication is termed semiconservative because each newly synthesized DNA molecule retains one of the original strands from the parent molecule This ensures that each daughter DNA molecule carries a combination of old and new genetic information maintaining the integrity of the genetic code

4 What are telomeres and why are they important Telomeres are protective caps at the ends of chromosomes These specialized sequences prevent the loss of genetic information during each round of replication as the DNA polymerase cannot fully replicate the very end of a chromosome Telomeres are crucial for maintaining chromosome stability and preventing cellular senescence

5 How does proofreading and repair ensure the accuracy of DNA replication

3 DNA replication is remarkably accurate but errors can still occur To ensure the fidelity of DNA replication cells employ a multilayered system of proofreading and repair mechanisms

Proofreading DNA polymerases themselves have a proofreading function detecting and correcting errors as they occur during synthesis

Mismatch Repair This process involves specialized enzymes that recognize and correct mismatched base pairs that escaped the initial proofreading

Understanding DNA replication is paramount for comprehending the foundation of life itself This test bank serves as a valuable resource for students teachers and anyone seeking to delve deeper into the intricacies of this fundamental biological process
